The site I am developing contains the publications of Taras Shevchenko National University of Kyiv. It is written in Django/Python and use MySql database to store data.

The current version displays information about university's heralds, journals and conferences. It supports two languages – Ukrainian and English.

The application consists of two parts. First part allows selecting the edition and viewing its publication. The second one is intended to load articles into database. It contains various forms to create/edit/delete an article. The demo version is located by link http://heraldknu.pythonanywhere.com/en/ See journal "Bulletin of KNU Series Sci. science". To connect to admin part go by link http://heraldknu.pythonanywhere.com/login/ Enter phys_math into username and password fields. The editor for "Bulletin of KNU Series Sci. science" will be opened.

My role is developing the application from scratch.
